

You are a data analyst working with an EdTech startup that wants to grow its offerings in recorded lectures. The company has collected data from various EdTech websites but needs your expertise to make sense of it.

Your task is to clean and analyse this data to uncover valuable insights.

Did Basic transformation - Removed blank rows, duplicates and errors.

Removed 100% empty columns and URL columns as of no use for analysis.

The ratings column had content as 4.9stars.... Extracted text before delimiter stars and changed datatype to decimal.

The subtitle column had content as Subtitles: English. Removed Subtitles: from it.

To ensure the startup can effectively leverage this information, you will create a dashboard that presents the following insights. Your analysis will help the company identify areas for improvement and opportunities for growth in their recorded lecture services.

The most Important Emphasis should be category wise. (So the category column must not be empty).

Added Slicer for category wise distribution

1. Examine the distribution of course types across categories to uncover trends and insights, enabling the client to strategically determine which course types to launch in specific categories for maximum impact and alignment with learner demand, also count the number of courses by category and sub-category.

Bar chart added for Number of courses by Course types.

2. Calculate the average number of views for each category, sub-category, and language to provide insights into viewer engagement patterns and inform strategic content development.

Slicer for category already added. Added bar chart for subcategory/language vs avg number of views. Using drill down option to get insights about viewership as per language.

3. What is the distribution of various Languages in which a particular course is created?

Added pie chart to display no of courses per language.

4. Determine the language preferences for each category based on viewer preferences, so that clients can optimise course accessibility and better align content with audience demand. Clients only want to analyse this data for the top 5 categories based on user preferences.

DAX query and Logic to display top 5 categories and their language preferences based on viewership.

```
Average number of views = IF( RANKX(ALL(Online_Courses[Category]),  
CALCULATE(AVERAGE(Online_Courses[Number of viewers]))) < 6,  
CALCULATE(AVERAGE(Online_Courses[Number of viewers])), BLANK())
```

First ranked all categories and used IF condition to display avg views for top 5 categories.

5. Investigate the relationship between the availability of subtitles and the number of views for courses to determine how subtitle options may impact viewer engagement and accessibility.

Created a new column using custom columns to display no of subtitles for each course ID.

```
=List.Count(Text.Split([Subtitle Languages], ","))
```

Then plotted a line chart for No of views against no of subtitles.

6. Identify the top three instructors for each category and subcategory based on ratings to highlight educators who consistently deliver high-quality content and effectively engage learners so that they can be approached by your client to make content for them and make this visual as static.

Split the column of instructors as one course was having multiple one. Then using unpivot option arranged all instructors in different rows with same course ID.

Created different slicer for sub-category.

Created table of Instructors name with their avg rating

Created a DAX query to rank instructors

```
Instructor_rating = IF( RANKX(ALL(Teachers[Name]),  
CALCULATE(AVERAGE(Teachers[Rating]))) <= 3,  
CALCULATE(AVERAGE(Teachers[Rating])), BLANK())
```

Then displayed only top 3 instructors using IF condition

7. Examine the relationship between course duration and the number of views to understand how the length of a course may influence viewer engagement and preferences for each category and sub-category, if course duration has a month (in each month only 60 hours of content) and for flexible schedules make the timing as 200 hours.

Basic standardisation done regarding content of column.

As mentioned by client converted duration in hours using custom column

```
= if Text.Contains(Text.Lower([Duration]), "months") then
    Number.FromText(Text.Select([Duration], {"0".."9"})) * 60
else if Text.Contains(Text.Lower([Duration]), "hours") then
    Number.FromText(Text.Select([Duration], {"0".."9"}))
else if Text.Contains(Text.Lower([Duration]), "minute") then
    Number.FromText(Text.Select([Duration], {"0".."9"})) / 60
else
    200
```

Then line chart plotted for Number of views by Duration
